

Async JavaScript at Netflix

Matthew Podwysocki @mattpodwysocki
github.com/mattpodwysocki/jsconfuy-2015

A black and white aerial photograph of a coastal town. In the center, a large suspension bridge spans a wide river or bay. The town below is built on a hillside, with numerous buildings and roads visible. In the far distance, a range of mountains is visible under a clear sky.

github.com/mattpodwysocki**

The Microsoft logo consists of the word "MICROSOFT" in a bold, black, sans-serif font. The letters are slanted slightly to the right. Above the letter "I", there are two small black dots, and above the letter "O", there are three black dots, creating a stylized 'M' shape.

NETFLIX

1/3

The Netflix App is Asynchronous

- **App Startup**
- **Player**
- **Data Access**
- **Animations**
- **View/Model Binding**

Three Years Ago...

- Complex asynchronous code
- Client and Server developers tightly coupled
- Different platforms, different approaches to async

Today at Netflix

- Rx used on server and client
- 30+ developers using Rx in 6 different languages
- Same asynchronous model everywhere

Real-Time is Everywhere...

SPIKE LATHAM

Let's Face It, Asynchronous Programming is Awful!

**“We choose to go to solve asynchronous
programming and do the other things,
not because they are easy, but because
they are hard”**

**Former US President John F. Kennedy - 1962
[citation needed]**

Callback Hell

```
function play(movieId, callback) {  
  var movieTicket, playError,  
    tryFinish = function () {  
      if (playError) {  
        callback(playError);  
      } else if (movieTicket && player.initialized) {  
        callback(null, ticket);  
      }  
    };  
  if (!player.initialized) {  
    player.init(function (error) {  
      playError = error;  
      tryFinish();  
    })  
  }  
  authorizeMovie( function (error, ticket) {  
    playError = error;  
    movieTicket = ticket;  
    tryFinish();  
  });  
}
```

culturepub.fr

ad ➔

Events and the Enemy of the State

```
var isDown = false, state;

function mousedown (e) {
  isDown = true;
  state = { startX: e.offsetX,
            startY: e.offsetY };
}

function mousemove (e) {
  if (!isDown) { return; }
  var delta = { endX: e.clientX - state.startX,
                endY: e.clientY - state.startY };
  // Now do something with it
}

function mouseup (e) {
  isDown = false;
  state = null;
}
```

```
function dispose() {
  elem.removeEventListener('mousedown', mousedown, false);
  elem.removeEventListener('mouseup', mouseup, false);
  doc.removeEventListener('mousemove', mousemove, false);
}

elem.addEventListener('mousedown', mousedown, false);
elem.addEventListener('mouseup', mouseup, false);
doc.addEventListener('mousemove', mousemove, false);
```

First Class Async with Promises

```
player.initialize()  
  .then(authorizeMovie, loginError)  
  .then(playMovie, unauthorizedMovie)
```

Breaking the Promise...

```
var promise;

input.addEventListener('keyup', (e) => {

  if (promise) {
    // Um, how do I cancel?
  } else {
    promise = getData(e.target.value).then(populateUI);
  }
}, false);
```

Aborting a fetch #27

[New issue](#)

Open **annevk** opened this issue 26 days ago · 182 comments

annevk commented 26 days ago

Owner

Goal

Provide developers with a method to abort something initiated with `fetch()` in a way that is not overly complicated.

Previous discussion

- [#20](#)
- [slightlyoff/ServiceWorker#592](#)
- [slightlyoff/ServiceWorker#625](#)
- [whatwg/streams#297](#)

Viable solutions

We have two contenders. Either `fetch()` returns an object that is more than a promise going forward or `fetch()` is passed something, either an object or a callback that gets handed an object.

3.0 cancellation overhaul #415

[New issue](#)[Open](#)

petkaantonov opened this issue on Dec 27, 2014 · 79 comments

petkaantonov commented on Dec 27, 2014

Owner

The current cancellation seems to be the most problematic feature due to some annoying limits in the design:

- Awkward API for attaching the callback that cancels the work (through typed catch handler)
- Cannot compose because it is impossible to tell the difference between rejection and cancellation (e.g. `Promise.all(...).cancel()` cannot do the obvious thing and also call `cancel()` on the promises in the array)
- `.cancel()` is asynchronous

Since all consumers and producers must be trusted/"your code", there is no reason to enforce that cancellable promises are single-consumer or create new primitives.

Edit: The below design has been scratched, see [#415 \(comment\)](#)

The Final Countdown...

```
var resource;  
  
try {  
    var resource = getResource();  
} catch (e) {  
    throw e;  
} finally {  
    resource && resource.dispose();  
}
```

```
getresource()  
.success(  
    function (resource) {  
        })  
.catch(  
    function (err) {  
        });  
  
// How do I clean up my resource?
```

stroom prosesing

Let's Face it, Streams¹ were terrible...

- The pause method didn't
- The 'data' event started immediately, ready or not!
- Can't just consume a specified number of bytes
- Pause and resume were impossible to get right...

Streams2 Electric Boogaloo

- Landed in 0.9.4
- Now supported “Object Mode”
- Flowing mode versus non-flowing mode
- Introduced the following Streams classes:
 - Readable
 - Writable
 - Duplex
 - Passthrough

Streams 33 1/3

- Landed in 0.11.2
- Adds cork/uncork/_writev

The General Theory of Reactivity

What is Reactive Programming Anyhow?

- “readily responsive to a *stimulus*”,
- .
- .

Wanna really know what Reactive Programming Is?

Functional Reactive Programming (FRP) is...

A concept consisting of

- Continuous Time
- Behaviors: Values over time
- Events: Discrete phenomena with a value and a time
- Compositional behavior for behavior and events

What it is not

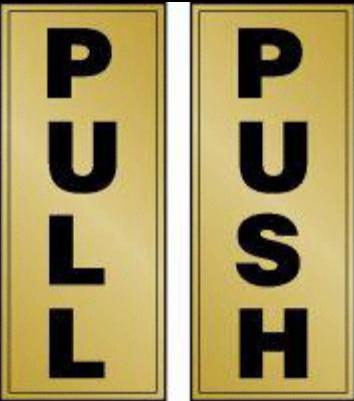

- High order functions on events like map, filter, reduce
- Most so-called FRP libraries out there...

Call Us RP, CEP, Compositional Event Processing

THE DUDE

He's the Dude. So that's what you call him. You know, that or, uh, His Dudeness, or uh, Duder, or El Duderino.

```
let source = getStockData();

source
  .filter((quote) =>
    quote.price > 30;
)
  .map((quote) =>
    quote.price;
)
  .forEach((price) =>
    console.log('> $30: ' + price);
);
```

```
let source = getStockData();

source
  .filter((quote) =>
    quote.price > 30;
)
  .map((quote) =>
    quote.price;
)
  .forEach((price) =>
    console.log('> $30: ' + price);
);
```

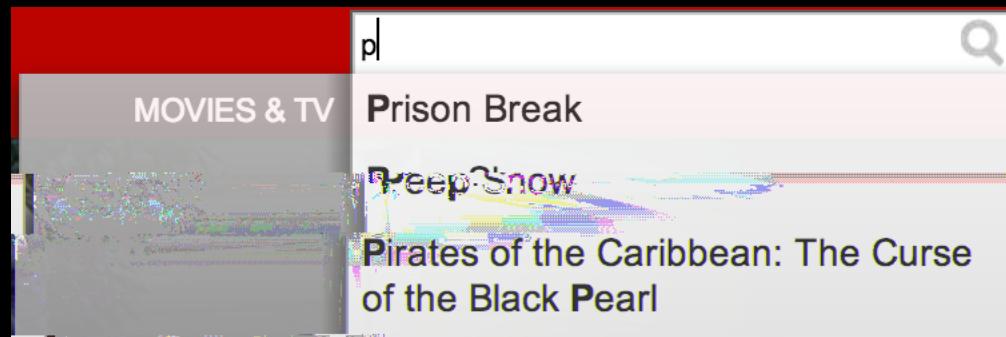

```
function fromEvent(element, event) {
  return Rx.Observable.create(observer => {

    function handler(e) {
      observer.onNext(e);
    }

    element.addEventListener(event, handler, false);

    return Rx.Disposable.create(() => {
      element.removeEventListener(event, handler, false);
    });
  }).share();
}
```

Netflix Search

```
let data = dom.keyup(input)
    .map(() => input.value)
    .debounce(500)
    .distinctUntilChanged()
    .flatMapLatest(
        (term) => search(term)
    );

```

```
let subscription = data.forEach
```

What exactly is Rx?

2. Query operations (map/filter/reduce)
3. How/Where/When
 - Schedulers: a set of types to parameterize concurrency

Observables - Querying UI Events

```
let mousedown = mousedown.flatMap((md) => {  
    // calculate offsets when mouse down  
    let startX = md.offsetX,  
        startY = md.offsetY;  
  
});
```

1

Observables - Querying UI Events

```
let mousedown = mousedown.flatMap((md) => {  
    // calculate offsets when mouse down  
    let startX = md.offsetX,  
        startY = md.offsetY;  
  
    // calculate diffs until mouse up  
    returnmousemove.map((mm) => {  
        return {  
            left: mm.clientX - startX,  
            top: mm.clientY - startY  
        };  
    })  
});
```

Observables - Querying UI Events

```
let mousedrag = mousedown.flatMap((md) => {  
    // calculate offsets when mouse down  
    let startX = md.offsetX,  
        startY = md.offsetY;  
  
    // calculate diffs until mouse up  
    return mousemove.map((mm) => {  
        return {  
            left: mm.clientX - startX,  
            top: mm.clientY - startY  
        };  
    }).takeUntil(mouseup);  
});
```

Netflix Row Update Polling

Client: Polling for Row Updates

```
function getRowUpdates(row) {  
  let scrolls = Rx.Observable.fromEvent(document, 'scroll');  
  let rowVisibilities =  
    scrolls.debounce(50)  
      .map((scrollEvent) => row.isVisible(scrollEvent.offset))  
      .distinctUntilChanged()  
      .share();  
  
  let rowShows = rowVisibilities.filter((v) => v);  
  let rowHides = rowVisibilities.filter((v) => !v);  
  
  return rowShows  
    .flatMap(Rx.Observable.interval(10))  
    .flatMap(() => row.getRowData().takeUntil(rowHides))  
    .toArray();  
}
```

Netflix Player

Player Callback Hell

```
function play(movieId, cancelButton, callback) {  
    var movieTicket,  
        playError,  
        tryFinish = function() {  
            if (playError) {  
                callback(null, playError);  
            }  
            else if (movieTicket && player.initialized) {  
                callback(null, ticket);  
            }  
        };  
    cancelButton.addEventListener("click", function() { playError = "cancel"; });  
    if (!player.initialized) {  
        player.init(function(error) {  
            playError = error;  
            tryFinish();  
        })  
    }  
    authorizeMovie(movieId, function(error, ticket) {  
        playError = error;  
        movieTicket = ticket;  
        tryFinish();  
    });  
});
```

Player With Observables

```
let authorizations =  
    player.init().flatMap(() =>  
        playAttempts.flatMap((movieId) =>  
            player.authorize(movieId)  
                .retry(3)  
                .takeUntil(cancels))  
    )  
);  
let subscription = authorizations.forEach(  
    (license) => player.play(license),  
    (error) => showDialog('Sorry, can't play right now.'));
```

RxSocketSubject

build passing

A simple web socket wrapper for RxJS

A more advanced

Install

With bower:

```
-S rx-socket-subject
```

```
bower install
```

With npm:

```
S rx-socket-subject
```

```
npm install -
```

Goals

This project is to produce an observable WebSocket implementation that meets a set of common needs for my current project I'm currently working on. RxJS-DOM has a fine WebSocket implementation, which I modelled the initial work on. However, I need something that also does the following:

The goals of this project I'm currently working on are to implement a WebSocket implementation that is:

```
let socket = RxSocketSubject.create(  
  [ 'ws://netflix.com/socket1',  
    'ws://netflix.com/socket2',  
    'ws://netflix.com/socket3']);  
  
socket.forEach((e) => {  
  if (e.data === 'end') {  
    socket.onCompleted();  
  }  
  if (e.data === 'bad data') {  
    socket.onError(new Error('bad data'));  
  }  
});  
  
socket.onNext('some data');
```

The Final Countdown...

```
try {  
  let resource = getData();  
  for (let data of resource) {  
    processItem(data);  
  }  
} catch (e) {  
  throw e;  
} finally {  
  resource && resource.dispose();  
}
```

```
var d = getData();  
d.retry(3)  
.catch(defaultData)  
.finally(() => d.cleanup())  
.forEach(data =>  
  processItem(data));
```

What is Rx?

Language neutral model with 3 concepts:

- 1. Observer/Observable**
- 2. Query operations (map/filter/reduce)**
- 3. How/Where/When**
 - Schedulers: a set of types to parameterize concurrency

The Role of Schedulers

Key questions:

- How to run timers?
- Where to produce events?
- Need to synchronize with the UI?

Schedulers are the answer:

- Schedulers introduce concurrency
- Operators are parameterized by schedulers
- Provides test benefits as well

```
let d = scheduler.schedule(  
  () => {  
    // Asynchronously  
    // running work  
  },  
  1000);
```

```
d.dispose();
```

Testing concurrent code: made easy!

```
let scheduler = new TestScheduler();

let input = scheduler.createHotObservable(
    onNext(300, 'JSConf.UY'),
    onNext(400, '2015'),
    onCompleted(500));

let results = scheduler.startWithCreate(() =>
    input.pluck('length')
);

results.messages.assertEqual(
    onNext(300, 9),
    onNext(400, 4),
    onCompleted(500));
```

Observables and Backpressure

Yes, Observables can have backpressure

- Can be lossy (pausable, sample, throttle)
- Can be lossless (buffer, pausableBuffered, controlled)

```
let pausable = chattyObservable.pausableBuffered();
pausable.pause();
pausable.resume();
```

```
let controlled = chattyObservable.controlled();
controlled.request(10);
```

Async/Await

Coming to a JavaScript Engine Near You!

- Adds `async` and `await` keywords for Promises
- Accepted into Stage 1 of ECMAScript 7 in January 2014

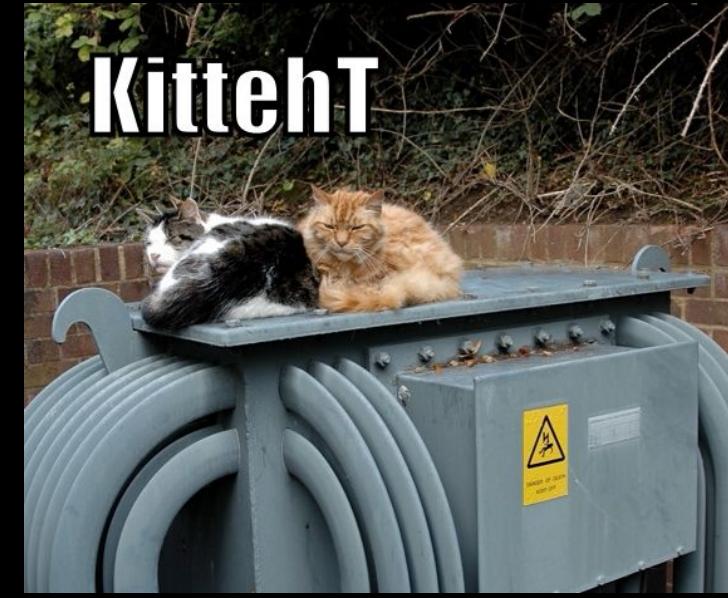

```
async function chainAnimationsAsync(elem, animations) {  
    let ret = null;  
    try {  
        for (let anim of animations) {  
            ret = await anim(elem);  
        }  
    } catch (e) { /* ignore and keep going */ }  
    return ret;  
}
```

Async/Await with Observables and Generators...

RxJS and Generators

- Adds `async` /`await` capabilities to single value Observables
- Available in any runtime that has Generators

```
Rx.spawn(function* () {  
  var result = yield get('http://jsconf.uy')  
    .retry(3)  
    .catch(cachedVersion)  
    .finally(doCleanup);  
  
  console.log(result);  
}());
```

Async Generators

ES7 and Beyond!

- First class events in the JavaScript runtime
- Proposed in June 2014 at TC39

```
async function* getDrags(element) {  
  for (let mousedown on element.mousedown) {  
    for (let mousemove on  
      documentmousemove.takeUntil(documentmouseup)) {  
      yield mousemove;  
    }  
  }  
}
```

Functional Programming in Javascript

Ever type down some code and realize you wrote the same logic over and over again? Functional programming is a way to write code that's more readable, reusable, and maintainable. In this tutorial you'll learn how to do that by learning five simple functions that you can use to perform operations on collections. These functions are called composable building blocks. You'll be surprised to learn that most of the operations you perform on collections can be accomplished with **five simple functions**.

1. map
2. filter
3. concatAll
4. reduce
5. zip

shorter, more self-descriptive, and more durable. The five functions hold the key to having all the tools you need to easily handle events and AJAX requests. In short, these five functions will probably be the most powerful, flexible, and useful functions you'll ever learn.

Here's my promise to you: if you learn these 5 functions your code will become shorter, more self-descriptive, and more durable. Also, for reasons that might not be obvious right now, you'll learn that these functions will probably be the most powerful, flexible, and useful functions you'll ever learn.
